

MODEL ALR-1

PRESSURE REDUCING REGULATOR WITH UNLOADER FOR AUXILIARY SUPPLY

OVERVIEW

Model ALR-1 is high performance, pressure loaded diaphragm-type, flow-to-open pressure reducing regulator. Design includes an internal pressure balancing piston-cylinder that provides high flow capacity and high pressure drop capability. The internal trim design allows the same basic unit to cover a broad range of pressure settings. Performance meets or exceeds that of competitive pressure loaded or pilot-operated designs. A back pressure regulator or "unloader" is piped to the top of the dome and is "set" to control the outlet pressure of the pressure reducing regulator.

FEATURES

Versatile:	Five basic materials and multiple trim material combinations to select from. Multiple methods of pressure loading.
Tight Shutoff:	Multiple composition materials provide Class IV or VI inboard leakage rates. Designed as a soft-seated valve.
Capacity:	Highest in the industry. Allows smaller body sizes than competitors in majority of applications.
Droop:	Highly accurate outlet pressure control, due to absence of range spring in design, provides almost zero "droop effect".
Trim Design	<u>FTO</u> and <u>pressure balancing</u> allows for higher inlet pressure. Results in unmatched <u>sensitivity</u> and <u>stability</u> . Internals are <u>cage-contained</u> within easily removable <u>quick change trim</u> .
Rangeability:	Basic valve gives outstanding rangeability due to close tolerances, balanced trim, and a broad range of elastomeric and metallic diaphragms and soft seats. Can be as high as 2000:1.
Heavy-Duty Guiding:	Both top and bottom guided to maintain stability and increased diaphragm life.
Failure Position:	Fails closed on loss of loading pressure.

APPLICATIONS

Designed as a gaseous service regulator. Excellent for atmospheric industrial gases - GN_2 , GOX , Ar , He , H_2 , CO_2 . Can be used as a utilities air regulator.

Function of service fluid, base trim material, diaphragm and dynamic seal design. See TABLES -2, -3, -4 & -6.

Temperature Range

-50° to +400°F (-46° to +204° C)

Limited by body/cover dome/diaphragm material combinations, and by elastomeric seat, static seal, dynamic seal - materials. See TABLE 1A through 1F and TABLE 5.

Alternate "CS" Mat'l - Steel - ASTM A352 Gr. LCC -
Minimum temperature -50 °F (-46 °C).

Inboard Leakage Rate

See TABLE 10

Lower Piston Spring

No lower piston spring; $P_2 = P_{Load}$.

Lower piston spring required; $P_2 < P_{Load}$.

See TABLE-9 for available spring ranges.

NOTE: Use a lower piston spring with the following applications:

1. When decaying inlet may reach 0 psig.

NOTES: 1. The body P vs. T ratings are the limiting variables for flanged end connections, unless further restricted by ASME B16.5.
2. No post-weld stress relieving performed.

OPT-31: BSP END CONNECTIONS. British Standard Pipe threads per ISO 7/1; used as an alternate to NPT ends. 1/2" – 2" (DN15–50) sizes only.

OPT-34: SPECIAL 14" FACE TO FACE DIMENSION FOR FLANGED END CONNECTIONS. Sizes 1/2" - 1", 1-1/2" & 2" only. See Opt-30 for standard face to face dimension.

OPT-55: SPECIAL CLEANING - GOX. BRZ or SST body materials only. Cleaning, assembly and packaging per Cashco Spec #S-1134, making unit suitable for Oxygen Service. **NOTE: Design Pressure Rating shall not exceed 375 psig (25.8 Barg) when body/topworks material is SST and process medium is oxygen.**

OPT-56: SPECIAL CLEANING. Cleaning per Cashco Spec. No. S-1542 for all body/cover dome materials. Higher cleaning level than std. commercial cleaning. NOT suitable for Oxygen Service.

OPT-85: PRESSURE TAPS. Provides second set of inlet and outlet 1/4" (DN8) - FNPT taps with plugs (same basic material as body) on backside of body. Includes second external sensing port tap. See Figure F2 for details on tap location for both STD. and Opt-85.

NOTE 1: Whenever body and topworks materials are mixed, the P vs. T ratings that should be applied are those which are lowest of the two materials.

Example: CS body, DI topworks; NPT end connections, 200°F temperature.

Because the topworks is not “end flanged”, use DI limits of "400 PSIG CWP 370/200F" from above to compare to CS limits from Table 1C value. The DI limits are lower, so ratings from Table1A MUST be used as the limits.

† Use 700 psig (48.2 Barg) inlet / 500 psig (34.4 Barg) outlet at 150°F as maximum limits.

NOTE 1: Whenever body and topworks materials are mixed, the P vs. T ratings that should be applied are those which are lowest of the two materials.

Example: BRZ body, DI topworks; NPT end connections, ambient temperature.

Because the topworks is not “end flanged”, use the DI limits of “400 PSIG CWP 370/200F” from TABLE 1A to compare to above TABLE 1B values. The DI limits are lower, so ratings from TABLE 1A MUST be used as the limits.

NOTE 1: These pressure ratings may be further derated by limitations through the Pressure Equipment Directive (2014/68/EU). Whenever body and topworks are mixed, the P vs. T ratings that should be applied are those which are lowest for the two materials.

Example: 600 lb. RF flanged steel body, full support diaphragm construction, at 200 deg F maximum temp would have a preliminary inlet to 3375 psig and outlet to 1350 psig, but if fitted with a ductile iron topworks pressure rating is only 370 psig. Must derate both the inlet and outlet to 370 psig. (Note: Topworks pressure rating, same as NPT design outlet pressure rating for the selected topworks material and diaphragm type.)

1. Consult Factory for T1<0°F.
2. Use Heat Exchange "coils" when loading fluid (process, auxiliary) T1>140°F
3. Use Heat Exchange "coils" when T1<0°F
4. Other components of a given loading or piloting system may have lower limits of pressure or temperature than the tubing & fittings.

N/A	All Unloader Range Springs
1-2	Required when Unloader Range Spring is 2 - 30 psig
2-5	For Unloader Range Springs 10 - 360 psig

- NOTES:**
1. The 2-5 psig lower piston spring is –
 - most commonly selected,
 - recommended for GF-TFE and CTFE seats,
 - recommended for tighter shutoff; i.e. lowest inboard leakage.
 3. Lower spring material matches main metallic trim in corrosion resistance.

*Inboard leak rates are the composite leakage of the seat leakage + dynamic seal leakage, considered as a single inboard leakage value.

Schemes To Reduce High Noise –

- Staging – using two separate throttling valves in series.
- dB Plates – using 1, 2 or 3-stage dB Plate cartridges downstream of a throttling valve.
- Paralleling – using two separate throttling valves in parallel.
- Combinations – using multiple methods of above three possibilities.

SUPPLEMENT for TABLE 13
CHEMICAL RESISTANCE

General Statement: Statements located within this technical bulletin concerning suitability of fluids with TFE materials are general statements, and should not be construed as recommendations. Any statements of suitability are the result of a compilation of various sources of information based on experience, tests, and published technical literature. No guarantee or warranty is in anyway implied for a given particular service or application.

Additional Reference: For an inclusive listing covering a broader range of service application fluids, reference “Handbook of Corrosion Resistant Piping”, P.A. Schweitzer, Industrial Press; or “Compass Corrosion Guide”, 2nd Edition, K.M. Pruett, Compass Publications. This publication will include information based on the following fluid variables:

1. Solution concentration
2. Pressure
3. Temperature

Inverse Sympathetic Ratio (ISR) - effect on regulator performance.

ALR-1 regulators utilize a top and bottom guide, "flow to open" trim design. The top guide also acts as a "balancing" piston to oppose the forces generated by the inlet pressure acting on the valve plug. A small residual imbalance between the piston and the valve plug helps to reduce seat leakage at high differential pressures across the seat joint. This same imbalance produces an Inverse Sympathetic Ratio, ISR effect, as the delta pressure across the seat (DP) changes. The magnitude of the ISR effect is given in Table -14.

TABLE 14		
Body Size		ALR-1
in	(DN)	
1/2", 3/4", 1"	(15,20,25)	0.03
1-1/4", 1-1/2"	(32,40)	0.04
2"	(50)	0.02
2-1/2", 3", 4"	(65,80, 100)	0.054

In a similar manner the ISR effect will produce an offset between the loading pressure, PL, and the pressure setpoint of a dome loaded regulator. For example, a 4" ALR-1 with an inlet pressure, P1 of 300 psig and an outlet pressure, P2 of 50 psig would require a loading pressure, $PL = (P1 - P2) \times ISR + P2 = (300 - 50) \times 0.054 + 50 = 63.5$ psig. In addition, if the DP changes, then a setpoint offset would be observed with a constant loading pressure.
